Customer Problem Statement Template

Create a problem statement to understand your customer's point of view. The Customer Problem Statement template helps you focus on what matters to create experiences people will love.

A well-articulated customer problem statement allows you and your team to find the ideal solution for the challenges your customers face. Throughout the process, you'll also be able to empathize with your customers, which helps you better understand how they perceive your product or service.

I am <i>Describe customer with 3-4 key characteristics - who are they?</i>	Describe the customer and their attributes here
I'm trying to <i>List their outcome or "job" they care about - what are they trying to achieve?</i>	List the thing they are trying to achieve here
but <i>Describe what problems or barriers stand in the way - what bothers them most?</i>	Describe the problems or barriers that get in the way here
because <i>Enter the "root cause" of why the problem or barrier exists - what needs to be solved?</i>	Describe the reason the problems or barriers exist
which makes me feel <i>Describe the emotions from the customer's point of view - how does it impact them emotionally?</i>	Describe the emotions that result from experiencing the problems or barriers

TEMPLATE EXAMPLE SCENARIO:

I AM
a traveler

I'M TRYING TO
book flights on my phone

BUT
It takes a long time

BECAUSE
The website is not responsive and lacks mobile UX

WHICH MAKES ME FEEL
Frustrated

Problem Statements for Project: Script-Controlled ACL

Below are the formulated Customer Problem Statements tailored for the **Script-Controlled ACL** project, addressing security administration, departmental data privacy, and user experience alignment.

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	ServiceNow System Administrator / Security Engineer managing record permissions across corporate entities.	Dynamically restrict record access based on specific field values (e.g. State, Confidentiality flag, Department).	Standard out-of-the-box role-based ACLs are static and apply unconditionally across the entire table.	Role-based access controls lack dynamic field-level logic and cannot execute custom server-side evaluation scripts without ACL scripting.	Concerned about data compliance breaches, frustrated by security gaps, and worried about unauthorized record exposure.
PS-2	Department Manager / Confidential Process Owner handling sensitive operational tickets.	Ensure team members only view and edit records matching their department or assigned status, restricting closed or confidential files.	Unauthorized users can still discover confidential ticket details through global search, reporting, or list view queries.	Out-of-the-box condition builders cannot dynamically compare active session attributes (<code>gs.getUser()</code>) against record fields on the fly.	Anxious about data privacy audit failures, stressed about confidential leaks, and lacking granular access control.
PS-3	Support System End User / Fulfiller working daily on assigned incidents and requests.	Focus efficiently on assigned tasks without encountering list truncation notices or confusing security denials.	List views display <i>'Security constraints prevent viewing'</i> warnings or empty rows when ACLs deny read access.	Scripted ACLs enforce row-level security but require an aligned 'Before Query' Business Rule to seamlessly hide restricted rows.	Confused by system security warnings, unproductive, and uncertain if critical work items are being hidden.
